

Editing your portfolio

Text, Google Drive videos, Instagram posts and photo albums

Everything on your site is controlled by one file: `content.js`. You do not need to know how to code, and you never need to touch `index.html`, `styles.css` or `script.js`. This guide covers the changes you'll actually make.

WHAT'S INSIDE

- | | | |
|---|----------------------------------|--|
| 1 | The one rule | Only ever edit <code>content.js</code> |
| 2 | Editing your words | Name, tagline, slate, bio, numbers |
| 3 | Adding a video | YouTube, Vimeo or Google Drive |
| 4 | Showing an Instagram post | Posts and reels, playing on your site |
| 5 | Adding a photo album | One entry becomes a slideshow |
| 6 | Skills, services, process | The bars, the chips, the cards |
| 7 | Publishing your changes | Commit, and Vercel does the rest |
| 8 | When something breaks | The five mistakes that cause 99% of it |

Keep this file. Everything in it stays true as long as you don't rename the site's files.

1. The one rule

If you remember nothing else, remember this.

Your site is built from five files. Only one of them holds your content:

THE FILES

```
content.js    <- YOUR WORDS, LINKS AND PHOTOS. Edit this one.
index.html    <- page structure. Leave alone.
styles.css    <- the design. Leave alone.
script.js     <- the machinery. Leave alone.
assets/       <- artwork + animation library. Leave alone.
```

Open content.js on GitHub, click the pencil icon, change the text between the quote marks, and commit. That's the whole job. The site rebuilds itself in a few seconds.

Everything is a list you can grow or shrink

Anywhere you see a block wrapped in { } sitting inside [], you can copy that whole block, paste it underneath, and change the details to add another one. Delete a block to remove that item. The layout adjusts by itself — you never have to rearrange anything.

2. Editing your words

The text that appears on screen, top to bottom.

Near the top of content.js you'll find the things visitors read first:

CONTENT.JS

```
name: "Tharun Kumar",
role: "Editor. Photographer. Filmmaker.",

hero: {
  slate: [
    { label: "ROLE",    value: "Editor / DP / Director" },
    { label: "STATUS",  value: "Open for freelance" },
    { label: "BASED",   value: "Chennai, India" },
    { label: "REEL",    value: "No. 001" },
  ],
  blurb: "One or two sentences under your name.",
},
```

- name — the giant wordmark on the landing screen.
- role — the orange line under it, and the words in the scrolling strip.
- slate — the small panel above your name, styled like a film slate. Add, remove or rename rows freely.
- blurb — the sentence or two under your name.

Further down, about.paragraphs holds your bio (each item in the list is one paragraph), about.caption is the little tag on your photo, and stats holds the numbers band. Numbers count up on their own when a visitor scrolls to them.

Straight quotes only

Type your text in the GitHub editor, not in Word or Notes. Those apps silently replace " with curly "smart quotes", which will break the file. If you've pasted from elsewhere and the site goes blank, this is almost always why.

3. Adding a video

YouTube, Vimeo and Google Drive all work the same way.

Find the work: [...] list in content.js. Copy one of the blocks inside it, paste it below, and fill in your details:

ONE VIDEO ENTRY

```
{
  category: "edits",                // "edits", "films" or "photography"
  title: "Wedding Recap – Aditi & Rohan",
  year: "2026",
  role: "Editor",
  description: "A 3-minute same-day edit cut to the first-dance track.",
  video: "https://youtu.be/YOUR_VIDEO_ID",
  image: null,
  link: null,
},
```

Just paste the normal share link

You do not need an embed link. All of these are converted for you automatically:

ACCEPTED LINKS

YouTube	https://youtu.be/ID
	https://www.youtube.com/watch?v=ID
Vimeo	https://vimeo.com/ID
Google Drive	https://drive.google.com/file/d/FILE_ID/view?usp=sharing

Google Drive: the one thing that catches everybody

- 1 In Google Drive, right-click your video and choose Share.
- 2 Under "General access", change "Restricted" to "Anyone with the link".
- 3 Click "Copy link" and paste the whole thing into the video field.

If you skip that sharing step, visitors see a permission wall instead of your video

The video will look fine to you, because you're signed in to the account that owns it. Always check your live site in a private/incognito window after adding a Drive video — that's the only way to see what a stranger sees.

Drive doesn't hand out preview images, so the card in the grid shows a plain textured placeholder. If you want a proper cover frame there, export a still from your video, put it in the repo, and point image at it, e.g. image: "assets/edits/recap-cover.jpg".

4. Showing an Instagram post

Your reels and posts, playing inside your own site.

If the work already lives on your Instagram, you don't need to re-upload it anywhere. Add an instagram line to a work entry and the post plays on your site — visitors never get sent away to the app.

ONE INSTAGRAM ENTRY

```
{
  category: "edits",
  title: "Campus fest aftermovie",
  year: "2026",
  role: "Editor",
  description: "Cut the same night, posted the next morning.",
  instagram: "https://www.instagram.com/p/YOUR_POST_CODE/",
  image: "assets/edits/fest-cover.jpg", // optional, see below
  link: null,
},
```

Getting the link

- 1 Open the post or reel in the Instagram app or on the web.
- 2 Tap the "..." menu (or the share arrow) and choose Copy link.
- 3 Paste it into the instagram field. Post links (/p/...) and reel links (/reel/...) both work.

Your post must be public

A private account's posts cannot be embedded anywhere. If your work account is private and you want it on your site, the post has to be on a public account.

Why the card looks like a purple Instagram tile

Instagram does not let other websites use its thumbnails without a developer token, so a card with only an Instagram link shows a branded placeholder in the grid. The post itself plays perfectly — it's only the preview image that's missing. If you'd rather have a real cover, screenshot a frame, add it to the repo and set image to that path.

5. Adding a photo album

One entry becomes a whole slideshow.

Photography works differently from video on purpose. One entry is one shoot, holding every photo from it — not one entry per photo.

ONE ALBUM

```
{
  category: "photography",
  title: "Marina Beach at Dawn",
  year: "2026",
  role: "Photographer",
  description: "A quiet morning shoot along the shore.",
  images: [
    "assets/photos/marina-dawn/1.jpg",
    "assets/photos/marina-dawn/2.jpg",
    "assets/photos/marina-dawn/3.jpg",
  ],
  link: null,
},
```

Getting the photos into the repo

- 1 On your repo page click "Add file", then "Upload files".
- 2 Drag the whole folder of photos onto the drop zone. Dragging a folder keeps its structure; clicking "choose your files" will not let you pick folders.
- 3 Commit, then list those exact paths in the images array above.

Use images (plural) for photography, never image (singular). The grid shows the first photo as the cover with a "N photos" badge, and hovering it ripples through the shoot.

What visitors get

- Clicking the card opens the album as a slideshow that plays itself, about four seconds a photo.
- A progress bar runs under the frame so they know when it's about to change.
- Hovering a photo holds it, so nothing slides away mid-look.
- A pause button, arrows, a thumbnail strip, arrow keys, and swipe on a phone all work.

6. Skills, services and process

The sections under your work.

The skills bars

Each bar is a label and a number out of 100. The bar fills and the number counts up when a visitor scrolls to it.

CONTENT.JS

```
skills: {
  chips: ["Video Editing", "Colour Grading", "Storyboarding"],
  bars: [
    { label: "Video Editing (Premiere Pro)", value: 85 },
    { label: "Motion Graphics & Title Design", value: 65 },
  ],
},
```

Change these numbers before anyone sees them

The percentages that shipped with your site are placeholders I estimated from your bio — they are guesses, not measurements. Set each one to something you'd be comfortable defending if a client asked you about it in an interview, or delete the bars list entirely and keep just the chips.

Services, process and testimonials

These three work the same way: a list of blocks you can copy, edit or delete. Testimonials starts empty on purpose — never invent a quote. Add them as real people send them, and the section appears by itself.

Deleting a whole section

Delete a section's entire block from `content.js` (for example everything from `services:` [down to its closing],) and that section disappears from the page, drops out of the menu, and the remaining sections renumber themselves. Nothing is left half-empty.

7. Publishing your changes

From edit to live in about a minute.

- 1 Go to your repository on github.com and click `content.js`.
- 2 Click the pencil icon at the top right of the file.
- 3 Make your change. Read it back once — check your commas and quote marks.
- 4 Scroll to the bottom and click "Commit changes".
- 5 Vercel notices the commit and redeploys automatically. Wait a few seconds, then refresh your live site.

If the site looks unchanged, do a hard refresh first: `Ctrl+F5` on Windows, or `Cmd+Shift+R` on a Mac. Browsers hold on to the old files longer than you'd expect.

8. When something breaks

Almost every problem is one of these five.

The whole site is blank or stuck on the loading screen

You have a typo in `content.js`. JavaScript is unforgiving about punctuation — one wrong character stops the entire file. In order of likelihood:

- A missing comma at the end of a line.
- Curly "smart quotes" pasted in from Word, Notes or WhatsApp instead of straight " quotes.
- A missing closing brace `}` or bracket `]`.
- An apostrophe inside double quotes is fine. A double quote inside double quotes is not.

To find it: open your live site, press `F12`, and click the Console tab. The red error message names the line number. Go to that line in `content.js` and look just above it.

A photo doesn't show up

The path in `content.js` doesn't match the file in the repo. Check capital letters and the file extension — `Photo.JPG` and `photo.jpg` are different files as far as the web is concerned.

A Google Drive video shows a permission page

Sharing is still set to Restricted. See section 3.

An Instagram post shows an empty white box

The post is on a private account, or the link was mistyped. See section 4.

Nothing animates

Your device has "reduce motion" switched on in its accessibility settings. That is not a fault — the site deliberately holds still for people who ask it to, and all the content is still there.

Still stuck?

Copy the red error message from the browser console and the block of `content.js` you were editing. Those two things together are almost always enough to spot the problem immediately.
